New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury, e.g. renal cancer

Disclosure; Fig 1A; 42pp; English.

The invention relates to a novel antibody, antibody derivative or antigen -binding polypeptide that inhibits proteolytic release of a soluble stangery didney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal zoncer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a human KIM-1 mucin domain related peptide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel antibody, antibody derivative or antigen binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a human KIM-1 mucin domain related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury,

The invention relates to a novel antibody, antibody derivative or antigen binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule. I (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal ancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a human KIM-1 mucin domain related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequence of human secreted proteins. The DNA and protein sequences of the invention are useful in the treatment of cardiovascular disorders, such as: arrhythmia, atherosclerosis, stroke, endocarditis, congestive heart failure,
New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; secreted protein; cardiovascular disorder; arrhythmia; atherosclerosis; stroke; endocarditis; congestive heart failure; rheumatic heart disease; cardiomyopathy; hemorrhoids; varicose veins; migraine; thrombosis; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; pulmonary disorder; renal disorder; proliferative disorder;

                                                                                                                                                                                                                                                                                                                              The invention relates to a novel antibody, antibody derivative or antigen -binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a human KIM-1 mucin domain related

rheumatic heart disease, cardiomyopathy, haemorrhoids, varicose veins, migraine, or thrombosis. The DNA and protein sequences may also be used for treating or preventing: neural disorders, immune system disorders, muscular disorders, reproductive disorders, gastrointestinal disorders, pulmonary disorders, renal disorders, proliferative disorders and/or secreted siseases. The present amino acid sequence represents a human secreted protein of the invention. NOTE: The present sequence is shown on the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel genes and their fragments which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids and proteins are useful in the diagnosis, treatment and prevention of conditions related to diabetes, e.g. hyperglycaemia, obesity, retinopathy, polyneuropathy, atherosclerosis, anaemia, stroke, gangrene, impotence, infection, cataract, renal disorders, or endocrine disorders. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A human secreted protein and nucleic acids useful for preparing a diagnostic or pharmaceutical composition for diagnosing or treating diabetes or conditions related to diabetes, e.g. hyperglycemia, obesity,

The polypeptides are useful for the preparation of a diagnostic or preventing diseases or conditions, such as neural, immune system, muscular, reproductive, disaction for diagnosing or and are useful for treating cor preventing diseases or conditions, such as neural, immune system, muscular, reproductive disorders and cancerous diseases and conditions. The polypeptides have immune activity, chemotactic activity, and binding activity, to treat and prevent neuronal damage which occurs in certain neuronal disorders or neuro-degenerative conditions such as Alzheimer's disease, Parkinson's disease, and acquired immunodeficiency syndrome (AIDS)-related complex, and to prevent skin aging due to sunburn by stimulating keratinocyte growth. The molecules are also useful to modulate mammalian characteristics including. The encoding sequences are therapy, for identifying individuals from minute biological samples, as additional DNA markers for restriction fragment length polymorphism (RRLP), in forensic piology, molecular weight markers on Southern gels, and diagnostic probes for the presence of a specific mRNA in a particular cellitype, to raise anti-DNA antibodies using DNA immunization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human secreted polypeptides for diagnosing and treating neural, immune system, muscular, reproductive, gastrointestinal, cardiovascular, renal, and proliferative disorders and cancerous diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence represents a human secreted protein of the invention.
```

```
Sequences AAB29802-B29850 represent the amino acid sequences of 49 human secreted proteins encoded by the genes AAC63410-C63458. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, analtiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing
                                                                                                                                                                                                                                                    Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidermidis polypeptide with any of 3772-fully defined anino acid sequences (SEQ ID NO: 3772-7544) as given in the specification. Also described are: a recombinant expression vector; a cell comprising a recombinant expression vector of (1); producing an S. epidermidis polypeptide; an isolated nucleic acid comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis infection, a subject for S. epidermidis infection; a subject for S. epidermidis infection; a recombinant or substantially infection; detecting the presence of a Staphylococcus substantially sample; a computer readable medium having recorded in it the nucleotide sequences with SEQ ID NO: 1-3772 or its fragments; a computer readable medium having recorded in it the nucleotide system for identifying fragments of commercial importance; a computer based system for identifying fragments of the Staphylococcus genome of sommercially important nucleic acid fragments of the Staphylococcus genome and/or plasmids of commercial for the diagnosis, genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of an Staphylococcus proterial of the anino acid sequence of a S. epidermidis botterial of
                                                                                                                                                                               antibacterial; vaccine; antisense therapy; Staphylococcus epidermidis; recombinant expression vector; infection; computer readable medium;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polypeptide and encoding nucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.
                                                                                                                                        Staphylococcus epidermis polypeptide seqid 6698.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 17; SEQ ID NO 6698; 741pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (BUSH/)
```

```
This sequence represents a repeat sequence that can be used in the proteinaceous substance of the invention. The proteinaceous substance comprises at least one stretch of amino acids derived from a first comprises at least one stretch of amino acids derived from a first the proteinaceous substance is useful in a method for attaching a substance to the cell wall of a microorganism, and the substance and either microorganism are useful in pharmaceutical compositions and vaccines, for delivery of substance to a cell. They are also useful in the thought are useful in pharmaceutical compositions and vaccines, for delivery of substance to a cell. They are also useful in the prior art anchoring processes and in foodstuffs. The new method targets substances to cells of a wide range of microorganisms, unlike prior art anchoring and trageting proteins which are usually selective for a limited set of microorganisms, which are usually non-recombinant, preventing restrictions on applications, and preventing potential problems of colonisation of the mucosal surfaces which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   generates long term exposure to the target antigens expressed, which can cause immune tolerance. Public consensus is against use of recombinant or attenuated strains, so the new technique is more likely to be accepted than prior art methods
                                                                                                                                                                                               AcmA repeat; consensus sequence; major peptidoglycan hydrolase; vaccine; cell wall attachment; substance delivery; diagnosis; bioadsorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New proteinaceous substance comprising a sequence consensus to a major peptidoglycan (AcmA), useful for attaching a substance to a cell wall.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of obtaining cell-wall material of a Gram-positive bacterium with improved capacity for binding to a Gram-positive bacterium with improved capacity for binding to a protein accoust substance (PS), or binding PS to cell-wall material of the bacterial of the bacterium, by treating the cell-wall material with a solution capable of removing a cell-wall component such as a protein, (lipo)teichoic acid or carbohydrate from the material. The method especially uses the binding of the PS with an anchor protein from the cell wall of the organism. The anchor protein is preferably the Lactococcus lactis AcmA cell wall binding domain or its homolog or functional derivative. The method is useful for improving binding of proteinaceous substance to cell wall material of gram-positive bacterium, e.g. for the preparation of a pharmaceutical composition comprising a vaccine useful for mucosal immunization and for preparing a biocatalyst. The preparation is also useful for generating bioadsorbents or biofilters for environmental purposes, incrobiocatalysts and diagnostic tools. Also for vaccination purposes, to elicit immunity for pathogens, like malaria and streptococcus pneumoniae. In an example of the invention, acid suchor fusion is investigated by the construction of a reporter plasmid anchor fusion is investigated by the construction of a reporter plasmid streptococcus pneumoniae protease maturation protein PpmA. This sequence regions in the generation of the fusion protein of the

                                                                                                                                                                                               therapeutic agents to predetermined sites in the body, particularly joints or solid tumours but can be used more generally for health, addical agricultural and cosmetic applications. (A) significantly increases the half-life of peptides in the circulation and, by providing controlled release, ensures relatively high bioavailability, allowing therapeutic use of agents that would otherwise be too toxic for systemic administration. The native Acma peptide targets Gram-positive bacteria but its homologues can be engineered to have different selectivity. The present sequence is used in the exemplification of the present invention.
The present invention describes a vehicle (A) for delivering a substance and to a predetermined site, which comprises (1); a system for inducing availability of at least one compartment of (A) towards the exterior; and, as targeting system for directing (A) to the site, an AcmA-type anchor protein (II). (A) are used for delivery of diagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; digestive system antigen; gene therapy; cancer; appendicitis;

New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury, e.g. renal cancer

Disclosure, Fig 1A; 42pp, English.

The invention relates to a novel antibody, antibody derivative or antigen binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a human KIM-1 mucin domain protein of the invention

include a KIM-1 mucin domain in addition to the KIM Ig domain, and may include a heterologous moiety such as an Fc moiety. The antagonist may be conjugated to a polymer such as polyethylene glycol. The KIM-1 antagonist is used in methods of: inhibiting activation of a B cell in a mammal; inhibiting disease relapse in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; treating a Th2 cell-mediated disease (e.g. myasthenia gravis, autoimmune haemolytic anaemia, Chagas disease, Grave's disease, idiopathic thrombocytopenia purpura, Wegener's granulomatosis, polyarteritis nodosa, rapidly progressive crescentic glomerulonephritis, graft-versus-host disease, or systemic lupus nephritis) or inflammatory disease or disorder (e.g. inflammatory bowel diseases such as Crohn's disease, ulcerative colitis, and ileitis); and inhibiting secretion of IFN-gamma by lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                Sequence 298 AA;

A plasmid comprising DNA encoding this sequence under control of a CMV promoter was used for transient constitutive expression of the polypeptide in mammalian cells in an example from the invention. The invention provides methods for therapeutically modulating immune function in autoimmune
                                                                                                                                                                          9

```
This protein, designated kidney injury related molecule (KIM), is upregulated in injured or regenerating tissue. Its amino acid sequence was deduced from a clone (see AAT96035) obtained from a human embryonic liver library, A 572-amino acid (see AAM38335) and a 307-amino acid rat KIM (see AAM38334) are also claimed. Recombinant KIM polypeptides can be expressed in prokaryotic and eukaryotic host cells using a claimed process. Soluble variants fused to a toxin, imageable compound or

diseases and other disorders of the mammalian immune system. A method is claimed for inhibiting signalling between a T cell and a second cell, e.g. an antigen-presenting cell, in a mammal. The method involves identifying a mammal with an immune disease or disorder, or one preparing to receive a tissue graft, and administering a KIM-1 antagonist, especially a polypeptide comprising: a KIM-1 Ig domain, and lacking a transmembrane domain and a KIM-1 cytoplasmic domain, an anti-KIM-1 antibody, or an antigen-binding fragment of an anti-KIM-1 antibody. Preferably, the KIM-1 antagonist is a soluble polypeptide, which can

-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a protein relating to the KIM-1 protein of the invention

cradionuclide, and IgG fusion proteins are also claimed. KIM, or an agonist, can used to treat renal disease and to promote the growth of new tissue or the survival of damaged tissue, generally in conditions where the binding of specific ligand to KIM stimulates cell growth, maintains cellular differentiation or reduces apoptosis, e.g. in cases of renal callular differentiation or reduces apoptosis, e.g. in cases of renal callular differentiation or reduces apoptosis, e.g. in cases of renal callular intibody specific for KIM can be used to treat renal disease, e.g. where binding of KIM to ligand results in neoplasia, loss of cellular function, susceptibility to apoptosis or promotion of inflammation, deliver imaging agents to KIM expressing cells in vivo or in vitro and measure KIM concentration by immunoassay.

Con in vitro and measure KIM concentration by immunoassay.

Con in vitro and measure calls can be determined by measuring KIM, particularly to diagnose or monitor the progress of disease or therapy.

Construction comprising KIM ligand or Mab with a toxin or radionuclide, and tumour cells that express KIM ligand can be inhibited with similarly can anti-KIM ligand antibody
                                                                                                                                                                                                                                                                                                                                                                                          ö

```
The present sequence is that of human kidney injury molecule-1 (KIM-1), a type I cell membrane glycoprotein and member of the T cell immunoglobilin (Ig) and mucin domain (TIM) family. This protein has 334 amino acids or 359 amino acids ADQ76690, depending on splice variation. It has been a discovered that treatment of a mammal with a KIM-1 antagonist alters the interaction of T cells and other immune System cells, e.g. dendritic cells, monocytes, macrophages and B cells and thereby strongly suppresses an IgG response to an antigen. Such treatment also eliminates 1gdl production by memory B cells in response to subsequent challenge cells, monocytes, macrophages of the binding of KIM-1 to its receptor reduces secretion of interferor—gamma by immune cells engaged in an autigen response in the mixed lymphocyte response assay. Based on these discoveries, the invention in autoimmune diseases and other disorders of antigen response in the mixed lymphocyte response assay. Based on these cantigen response in the mixed lymphocyte response assay. Based on these discoveries, the invention in autoimmune diseases and other disorders of colls. The mammalian immune system. A method is claimed for inhibiting mammalian immune system. A method is claimed for inhibiting calling between a T cell and a second cell, e.g. an antigen-presenting signalling between a T cell and a second cell, e.g. an antigen-binding coll, in a mammal. The method involves identifying a mammal with an and administering a KIM-1 antibody. Preferably, the KIM-1 antibody, or an antigen-binding fragment of an anti-KIM-1 antibody, or an antigen-binding fragment of an anti-KIM-1 antibody, or an antigen-binding collubs polypeptica, which can include a KIM-1 methods, which an include a kiM-1 antibody, or an antigen-binding collubs polypeptical purple, and may include a heterologous moiety such as an FC collubs polypeptical purple of a B cell in a mammal; inhibiting activation of a B cell in a mammal inhibiting activation of a B cell in a mammal inhibiting activatio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         210 MPLPRQNHEPVAISPSSPQPAETHPTTLQGAIRREPISSPLYSYTTDGNDTVTESSDGLW 269

                                                                                                                                                                                                                                New polypeptide, useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     249
                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated human NOVX polypeptide, where X is la to 1d or 2a to 2h, or its mature form, a sequence that is at least 95 $ identical to it, or a sequence comprising one or more conservative substitutions in the amino add sequence. The NOVX polypeptide, and nucleic acid sequence encoding it, has cytostatic and antiinflammatory activities, and can be used in gene therapy, and in vaccines. The NOVX polypeptide is useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing. The present sequence represents a pCR2.1-CG57008-03-S843 158 protein insert, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

                                                                                                                                                                                     New polypeptide, useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MPLPRQNHEPVATSPSSSPQPAETHPTTLQCAIRREPTSSPLYSYTTDGNDTVTESSDGLW 249
                                                                                                                                                                                                                                                                                                                                                              present invention describes an isolated human NOVX polypeptide, where
                                                                                                                                                                                                                                                                                                                                                                             X is la to 1 or 2a to 2h, or its mature form, a sequence that is at least 95 % identical to it, or a sequence comprising one or more conservative substitutions in the amino acid sequence. The NOVX polypeptide, and nucleic acid sequence encoding it, has cytostatic and antiinflammatory activities, and can be used in gene therapy, and in vaccines. The NOVX polypeptide is useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. represents human NOVIa from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

ABRS521 to ABRS6709. Also described: (1) determining the proteins given in ABRS5521 to ABRS6709. Also described: (1) determining the presence or absence of a pathological call in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the uncleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a carginal servening assay. The nucleic acid is useful for diagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow, bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, charces, prostate, skin and uterus), wounds, ischaemia, heart diseases, atherosclerosis and endometriosis. The nucleic acid is also useful in drug screening, particularly for identifying agents for treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-regulated in specific cancers (e.g. about 1031 genes up-regulated in acute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MPLPRQNHEPVATSPSSPQPAETHPTTLQGAIRREPTSSPLYSYTTDGNDTVTESSDGLW 60
                                     New genes that are up-regulated or down-regulated in cancers, useful a
markers for diagnosing e.g. cancer, ischemia or heart diseases, or as
therapeutic targets for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              T cell immunoglobulin domain; mucin domain; TIM; TIM-1; TIM-2; TIM-3; TIM-4; immune dysfunction; chromosome 5; malignancy; allergy; eczema; myelodysplastic syndrome; airway hyperreactivity; cancer; asthma; allergic T cell response; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

domain-1 (TIM-1) polypeptide. The specification describes TIM-1, TIM-2, TIM-3 and TIM-1) polypeptide. The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with conserved IgV and mucin domains. The locus comprising the TIM family is genetically associated within immune dysfunction, including asthma. The TIM genetically associated within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperreactivity and allergic T cell responses, and other variants associated with protection against these responses. T cells express TIM preferentially express TIM-3, while Th2 cells preferentiation. Th1 cells preferentially express TIM-1. TIM polypeptides and polymucleotides are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases
                                              New nucleic acid comprising a mammalian T cell Immunoglobulin domain and Mucin domain gene sequences, useful for treating cancer or asthma, allergy, eczema or autoimmune disease.
                                                                                                                                                      present sequence is a human T cell immunoglobulin domain and mucin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   210 MPLFRQNHEBVATSPSSPQFAETHPTTLQGAIRREPTSSPLYSYTTDGNDTVTESSDGLW

New nucleic acid comprising a mammalian T cell Immunoglobulin domain and Mucin domain gene sequences, useful for treating cancer or asthma,

```
ö
                                                           The present sequence is a human T cell immunoglobulin domain and mucin domain-1 (TIM-1) polypeptide. The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with conserved IgV and mucin domains. The locus comprising the TIM family is genetically associated with immune dysfunction, including asthma. The TIM gene family is located within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperreactivity and allergic T cell responses, and other variants associated with protection against these responses. T cells express TIM protections, which critically regulate CD4 T cell differentiation. This cells preferentially express TIM-1. TIM polypeptides and polymocleonides are useful for treating cancer,

```
The present invention describes a method for detecting a bladder cancer-
associated transcript in a cell from a patient. The method comprises
contacting a biological sample from the patient with a polynucleotide
that selectively hybridises to a sequence that is 80 % identical to a
table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
encode the human bladder cancer-associated proteins given in ABR48146 to
ABR48242). Bladder cancer-associated sequences from the present invention
have cytostatic activities, and can be used in antisense gene therapy and
in vaccine production. The method can be used for detecting a bladder
cancer-associated transcript in a cell from a patient. The method is
useful in diagnosing or treating bladder cancer and in screening for
compounds that modulate bladder cancer, such as hormones or antibodies.
The nucleic acid molecules from the present invention may be used in
various screening and diagnostic methods, and for gene therapy, vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and/or antisense/inhibition applications

New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury, renal cancer. e.9

Disclosure; Page 40-41; 42pp; English.

The invention relates to a novel antibody, antibody derivative or antigen -binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells.

                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated human NOVX polypeptide, where X is la to 1d or 2a to 2h, or its mature form, a sequence that is at least 95 % identical to it, or a sequence comprising one or more conservative substitutions in the amino acid sequence. The NOVX polypeptide, and nucleic acid sequence encoding it, has cytostatic and antiinflammatory activities, and can be used in gene therapy, and in vaccines. The NOVX polypeptide is useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing. The present sequence represents human NOV1b from the present invention.
The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a protein relating to the KIM-1 protein of the invention
                                                                                                                                                                                              1 MPLPRONHEPVATSPSSPOPAETHPTTLQGAIRREPTSSPLYSYTTDGNDTVTESSDGLW

of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention also relates to expression vectors and host cells comprising a nucleic acid of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as positasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neconscularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a polypeptide of the invention.

Use of a kidney injury molecule-1 (KIM-1) antagonist for e.g. treating Th2 cell-mediated diseases or inflammatory diseases, inhibiting B cell activation, or inhibiting production of a subset of antibodies against one or more antigens.

Disclosure; SEQ ID NO 1; 68pp; English.

The present sequence is that of human kidney injury molecule-1 (KIM-1), a type I cell membrane glycoprotein and member of the T cell immunoglobulin (IUM) family. This protein has 334 amino acids and meuton domain (TIM) family. This protein has 334 amino acids depending on spile variation. It has been discovered that treatment of a mammal with a KIM-1 antagonist alters the interaction of T cells and other immune system cells, e.g. dendritic clars, macrophages and B cells, and thereby strongly strongly suppresses an IGG response to an antigen. Such treatment also eliminates (IGM) production by memory B cells in response to subsequent challenge with the antigen. Blockage of the binding of KIM-1 to its receptor antigen response in the mixed lymphocyte response assy. Based on these classonses in the mixed lymphocyte response and other disorders of the mammalian immune system. A method is claimed for inhibiting coldulating information provides methods for therapeutically coldulating between a T cell and a second cell, e.g. an antigen-presenting signal information is a second cell, e.g. an antigen-presenting signal information in autoimmune diseases and other disorders, or one preparing to receive a tissue graft, and administering a KIM-1 antagonist, sepecially a polypeptide comprising a KIM-1 antagonist, sepecially a polypeptide comprising a KIM-1 antagonist, sepecially a polypeptide of an anti-KIM-1 antibody. Preferologous moiety such as an FC moiety. The antagonist may be conjugated to a polymer such as an FC moiety. The antagonist may be conjugated to a polymer such as an FC moiety. The antagonist may be conjugated to a polymer such as an elapse in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope idiopathic thrombocytopenia purpura, Wegener's granulomatosis, polyarteritis nodosa, rapidly progressive crescentic glomerulonephritis, graft-versus-host disease, or systemic lupus nephritis) or inflammatory disease or disorder (e.g. inflammatory bowel diseases such as Crohn's disease, ulcerative colitis, and ileitis); and inhibiting secretion of IFN-gamma by lymphocytes.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17,

probable outer membrane protein - Helicobacter pylori (strain J99)
C;Species: Helicobacter pylori
A;Variety: strain J99
C;Species: Helicobacter pylori
A;Variety: strain J99
C;Accession: G71957
R;Alm, R.A.; Ling, L.S.L.; Moir, D.T.; King, B.L.; Brown, E.D.; Doig, P.C.; Smith, D.R.; Irves, C.; Gibson, R.; Merberg, D.; Mills, S.D.; Jiang, Q.; Taylor, D.E.; Vovis, G.F.; J Nature 397, Jf6-180, 1992
A;Title: Genomic sequence comparison of two unrelated isolates of the human gastric pathc A;Reference number: A71800; MUD: 99120557; PMID: 9923682
A;Accession: G71957
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-479 cARN>

chitinase (EC 3.2.1.14) II precursor - Aeromonas sp.
C;Species: Aeromonas Sp.
C;Species: Aeromonas Sp.
C;Species: D-Jul-1996 #sequence_revision 19-Jul-1996 #text_change 09-Jul-2004
C;Accession: I39540
R;Ueda, M; Kawaguchi, T: Arai, M.
R;Ueda, M; Kawaguchi, T: Arai, M.
A;Friment. Biocang. 789, 205-211, 1994
A;Frite: Molecular cloning and nucleotide sequence of the gene encoding chitinase II from A;Reference number: I39540
A;Accession: I39540
A;Accession: I39540
A;Accession: BNA
A;Residues: 1-542 <RES>
A;Residues: 1-542 <RES>
C;Keywords: glycosidase; hydrolase; polysaccharide degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2 PLPRQNHEPVATSPSSPQPAETHPTTLQGAIRREPTSSPLYSYTTDGNDTVTESSDGLWN 61

New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury, e.g. renal cancer

Disclosure; Fig 1A; 42pp; English.

The invention relates to a novel antibody, antibody derivative or antigen binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal acancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a human KIM-1 mucin domain protein of the invention

inhibiting disease relapse in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; treating a Th2 cell-mediated disease (e.g. mysathenia gravis, autoimmune haemolytic anaemia. Chagas disease, Grave's disease, idiopathic thrombocytopenia purpura, Wegener's granulomatosis, polyarteritis nodosa, rapidly progressive crescentic glomerulonephritis, graft-versus-host disease, or systemic lupus nephritis) or inflammatory disease or disorder (e.g. inflammatory bowel diseases such as Crohn's disease, ulcerative colitis, and ileitis); and inhibiting secretion of IFN-gamma by lymphocytes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       regulated in injured or regenerating tissue. Its amino acid sequence was deduced from a clone (see AAP36035) obtained from a human embryonic liver library, A 572-amino acid (see AAW38335) and a 307-amino acid rat KIM see AAW38334) are also claimed. Recombinant KIM polypeptides can be expressed in prokaryotic and eukaryotic host cells using a claimed process. Soluble variants fused to a toxin, imageable compound or adoinuclide, and IgG fusion proteins are also claimed. KIM, or an agonist, can used to treat renal disease and to promote the growth of new tissue or the survival of damaged tissue, generally in conditions where the binding of specific ligand to KIM stimulates cell growth, maintains cellular differentiation or reduces apoptosis, e.g. in cases of renal failure, mephritis, kidney transplants, toxic or hypoxic injury. A failure, mephritis, kidney transplants, tox be used to treat renal disease, e.g. where binding of KIM to ligand results in neoplasia, loss of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding kidney injury related molecule - which is upregulated in injured or rejenerating tissue, useful to promote growth of new tissue and survival of damaged tissue.

The present sequence is that of a polypeptide comprising the extracellular domain (residues 1-290) of human kidney injury molecule-1 (XIM-1) ADQ76690 fused to a C-terminal 6xHis tag peptide. A plasmid comprising DNA encoding this sequence under control of a CWV promoter was used for transient constitutive expression of the polypeptide in mammalian cells in an example from the invention. The invention provides methods for therapeutically modulating immune function in autoimmune cliseases and other disorders of the mammalian immune system. A method is clismed for inhibiting signalling between a T cell and second cell, e.g. an antigen-presenting cell, in a mammal. The method involves identifying a mammal with an immune disease or disorder, or one preparing corrective a tissue graft, and administering a KIM-1 antagonist, cepecially a polypeptide comprising: a KIM-1 ig domain, and lacking a transmembrane domain and a KIM-1 cytoplasmic domain, an anti-KIM-1 antagonist is a soluble polypeptide, which can include a KIM-1 mucin domain in addition to the KIM Ig domain, and may conjugated to a polymer such as polyethylene glycol. The KIM-1 antagonist is include a heterologous moiety such as an Pc moiety. The Alm-1 antagonist is conjugated to a polymer such as polyethylene glycol. The KIM-1 antagonist is used in methods of: inhibiting activation of a B cell in a mammal;

The invention relates to a novel antibody, antibody derivative or antigen binding polypeptide that inhibits s proteolytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence reperseents a protein relating to the KIM-1
cellular function, susceptibility to apoptosis or promotion of inflammation, deliver imaging agents to KIM expressing cells in vivo or in vitro and measure KIM concentration by immunoassay. Banage/regeneration of renal cells can be determined by measuring KIM, particularly to diagnose or monitor the progress of disease or therapy. KIM-expressing tumour cells can be inhibited by treatment with a fusion protein comprising KIM ligand on Mab with a toxin or radionuclide, and tumour cells that express KIM ligand can be inhibited with similarly tagged KIM or anti-KIM ligand antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury,

protein of the invention

```
The present sequence is that of human kidney injury molecule-1 (KIM-1), a type I cell membrane glycoprotein and member of the T cell immunoglobulin (Ig) and mucin domain (TIM) family. This protein has 334 amino acids or 359 amino acids ADQ76690, depending on splice variation. It has been discovered that treatment of ammmal with a KIM-1 antagonist alters the interaction of T cells and other immune system cells, e.g. dendritic cells, monocytes, macrophages and B cells, and thereby strongly suppresses an IgG response to an antigen. Such treatment also eliminates lgG1 production by memory B cells in response to subsequent challenge with the antigen. Blockage of the binding of KIM-1 to its receptor reduces secretion of interferon-gamma by immune cells engaged in an antigen response in the mixed lymphocyte response assay. Based on these discoveries, the invention provides methods for therapeutically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "C-terminal region unique to this splice variant"

modulating immune function in autoimmune diseases and other disorders of the mammalian immune system. A method is claimed for inhibiting signalling between a T cell and a second cell, e.g. an antigan-presenting cell, in a mammal. The method involves identifying a mammal with an immune disease or disorder, or one preparing to receive a tissue graft, can and administering a KIM-1 antagonist, especially a polypeptide comprising: a KIM-1 in addition and a kIM-1 cytoplasmic domain, and include a transmembrane domain and a KIM-1 cytoplasmic domain, and may include a KIM-1 mucin domain in addition to the KIM ig domain, and may include a KIM-1 mucin domain in addition to the KIM ig domain, and may include a RIM-1 mucin domain in addition complety. The antagonist is used in methods of:

CC moiety. The antagonist may be conjugated to a polymer such as polyethylene glycol. The KIM-1 antagonist is used in methods of:

inhibiting activation of a B cell in a mammal; inhibiting disease relapse in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting adisease (e.g. mysthenia gravis, autoimmune haemolytic anaemia, Chagas disease, Grave's disease, catterities nodesa, rapidly progressive crescentic glomerulonephritis, graft-versus-host disease, or systemic lupus nephritis) or inflammatory disease or disorder (e.g. inflammatory bowel diseases such as Crohn's transamma but inhibiting secretion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IFN-gamma by lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Seguence 334 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing.
               where
                            X is la to 1 or 2a to 2h, or its mature form, a sequence that is at least 95 % identical to it, or a sequence comprising one or more conservative substitutions in the amino acid sequence. The NOVX polypeptide, and nucleic acid sequence encoding it, has cytostatic and antiinflammatory activities, and can be used in gene therapy, and in vaccines. The NOVX polypeptide is useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing. The present sequence represents a pCR2.1-CG57008-03-S843 158 protein insert, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated human NOVX polypeptide, where X is la to 1d or 2a to 2h, or its mature form, a sequence that is at least 95 % identical to it, or a sequence comprising one or more conservative substitutions in the amino acid sequence. The NOVX polypeptide, and nucleic acid sequence encoding it, has cytostatic and antiinflammatory activities, and can be used in gene therapy, and in vaccines. The NOVX polypeptide is useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. represents human NOVIa from the present invention.
                                                                                                                                                                                                                                                                                                         Gaps
               present invention describes an isolated human NOVX polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mesri M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; NOVX; cytostatic; antiinflammatory; gene therapy; vaccine; renal cancer; inflammation; tissue typing.

comprises the sequence of any of the genes that are up-regulated with microardian described and sold molecule, which comprises the sequence of any of the genes that are up-regulated in regulated in specific cancers (e.g. about 1031 genes up-regulated in acute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer related gene mucleotide sequences which encode the proteins given in ABRS8521 to ABRS8709. Also described above; (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a comparient by administering to the patient the antibody above; and (7) a drug screening assay. The nucleic acid is useful as diagnostic markers or therapeutic targets. In particular, the nucleic acid is useful for diagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow, bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, concerned, skin and uterus), wounds, ischaemia, heart diseases, atherosclerosis and endometriosis. The nucleic acid is also useful in drug screening, particularly for identifying agents for treating these pathologies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated nucleic acid molecule, which

The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with conserved IgV and mucin domains. The locus comprising the TIM family is genetically associated with immune dysfunction, including asthma. The TIM gene family is located within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperreactivity and allergic T cell responses, and other variants associated with protection against these responses. T cells express TIM protecting, which critically regulate CD4 T cell differentiation. This cells preferentially express TIM-1. TIM polypeptides and polymuchectides are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059 cencode the human bladder cancer-associated proteins given in ABR48446 to ABR48242). Bladder cancer-associated proteins given in ABR48446 to have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The mucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting a bladder cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a bladder cancer-associated polynucleotide or antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; gene therapy; antibody; antigen; antigen-binding; proteolytic release; inhibitor; kidney injury molecule-1; KIM-1; renal disease; injury; renal cancer; human.

The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with faconserved IgV and mucin domains. The locus comprising the TIM family sentically associated with immune dysfunction, including asthma. The TIM gene family is located within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperreactivity and allergic T cell responses, and other variants protection against these responses. T cells express TIM proteins, which critically regulate CD4 T cell differentiation. This cells preferentially express TIM-1. TIM polypeptides and polymuclocides are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid comprising a mammalian T cell Immunoglobulin domain and a domain gene sequences, useful for treating cancer or asthma,
                                                                                                                                                                                                                                                                                                                 T cell immunoglobulin domain, mucin domain; TIM; TIM-1; TIM-2; TIM-3; TIM-4; immunoglobulin dysfunction; chromosome 5; malignancy; allergy; eczema; myelodygplastic gyndrome; airway hyperreactivity; cancer; asthma; allergic T cell response; autoimmune disease.

New polypeptide, useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing.
                                                                                                                                                                 The present invention describes an isolated human NOVX polypeptide, where X is la to 1d or 2a to 2h, or its mature form, a sequence that is at least 95 % identical to it, or a sequence comprising one or more conservative substitutions in the amino acid sequence. The NOVX polypeptide, and nucleic acid sequence encoding it, has cytostatic and antiinflammatory activities, and can be used in gene therapy, and in vaccines. The NOVX polypeptide is useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing. The present sequence represents human NOV1b from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, differential expression, cancer, angiogenic disorder, fibrotic disorder, psoriasis, ischaemia; heart disease, atherosclerosis, inflammatory disease, autoimmune disease, retinal neovascularistation syndrome, scarring, uterine fibroid, detection, diagnosis, prognosis, drug screening; drug targeting, wound healing, contraception, cytostatic, cardiant, immunomodulatory; vulnerary, gene therapy; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cancer/angiogenesis/fibrosis-related polypeptide, SEQ ID NO:302
                                                                                                                                                                                                                                                                                                                                                                       Score 225; DB 7; Length 359;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel antibody, antibody derivative or antigen baining polypeptide that inhibits proteclytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a protein relating to the KIM-1 protein of the invention
                                                                                                                                                                                                                                                                                         New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury,

                                                                        Region
   whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention are by detecting a polypeptide of the invention. The invention or by detecting a polypeptide of the invention. The nucleic acid of the invention, antibodies which specifically bind a polypeptide of the invention; antibodies for drug targeting; and methods of screening for medulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                              Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                      The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
```

```
The present sequence is that of human kidney injury molecule-1 (KIM-1), a type I cell membrane glycoprotein and member of the T cell immunoglobulin (IG) and mucin domain (TIM) family. This protein has 334 amino acids ADO76696 or 359 amino acids, depending on splice variation. It has been discovered that treatment of a mammal with a KIM-1 antagonist alters the interaction of T cells and other immune system cells, e.g. dendritic cells, monocytes, macrophages and B cells, and thereby strongly controlly monocytes, macrophages and B cells, and thereby strongly controlly by memory B cells in response to subsequent challenge with the antigen. Blockage of the binding of KIM-1 to its receptor. The reduces secretion of interferon-gamma by immune cells engaged in an antigen response in the mixed lymphocyte response assay. Based on these discoveries, the invention provides methods for therapeutically conting immune system. A method is claimed for inhibiting cell, in a mammalian immune system. A method is claimed for inhibiting signalling between a T cell and a second cell, e.g. an antigen-presenting signalling between a T cell and a second cell, e.g. an antigen-presenting cell, in a mammal. The method involves identifying a mammal with an antigentary and administering a KIM-1 glomain, and lacking a transmembrane domain and a comprising: a KIM-1 ig domain, an anti-KIM-1 antigonist, especially a polypeptide comprising a KIM-1 antigonist, especially a polypeptide comprising a mathi-KIM-1 antigonist, especially a polypeptide comprise of an anti-KIM-1 antigonist, especially a polypeptide soluble polypeptide, which can include a KIM-1 mucin domain in addition contexty. The antagonist may be conjugated to a polymer such as an FC controlling activation of a B cell in a memmal; inhibiting desense relapsee. Inhibiting activation of a B cell in a memmal in antichimmune disease relapsee.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disease; treating a Th2 cell-mediated disease (e.g. myasthenia gravis, autoimmune haemolytic ransemia, Chagas disease, Grave's disease, idiopathic thrombocytopenia purpura, Wegener's granulomatosis, polyarteritis nodos, rapidly progressive crescentic glomerulonephritis, graft-versus-host disease, or systemic lupus nephritis) or inflammatory disease or disorder (e.g. inflammatory bowel diseases such as Crobn's disease, ulcerative collits, and lleitis); and inhibiting secretion of
